

IV. CONCLUSIONS

The results of the work have shown that there is no clearly established pattern of the occurrence of incidents of aggressive behavior. However, it is possible to establish similar dynamics of incident occurrence between UPZ groups, except for those spatial units that show a random behavior of incidents.

The spatial-temporal characterization of the dynamics of incidents of aggressive behavior and personal injury in Bogotá is a relevant finding for decision-makers to design and test the success of prevention strategies.

UPZ with similar behavior also show a degree of similarity with respect to socioeconomic conditions and land use. This can be an important finding that must be statistically evaluated. In the same way, it is expected to be able to relate the incidents with other variables such as demographic variables and social, cultural and sports events.

ACKNOWLEDGEMENTS

This work was funded by the project “Diseño y validación de modelos de analítica predictiva de fenómenos de seguridad y convivencia para la toma de decisiones en Bogotá”, at Bank of National Investment Programs and Projects, National Planning Department, Government of Colombia (BPIN: 2016000100036).
